3: How We used agentic ai/ github copilot for generating code and this project.(github copilot in action)

CHAT

← ADD JWT AUTHENTICATION SYSTEM

Reviewed 5 files and checked authentication setup

Checking backend dependencies for JWT and Spring Security.

Searched for regex in backend/pom.xml and implemented JWT Authentication

Applying backend authentication endpoints so JWT login/register works.

Updated AuthController.java and inspected JWT implementation

Verifying backend build so the JWT security setup is valid.

Run `bash` command within `/workspaces/Blood-Donation-2/backend`?

`mvn -q compile`

✓ Changes directory to `/workspaces/Blood-Donatio...` ⓘ

CHAT

← ADD JWT AUTHENTICATION SYSTEM

Endpoints available:

- `POST /api/auth/register`
- `POST /api/auth/login`

Frontend

JWT flow is handled by:

- `auth.service.ts`
- `auth.interceptor.ts`

The frontend stores `AuthResponse` in `localStorage` and automatically attaches `Authorization: Bearer <token>`.

Note

I tried to compile the backend, but the workspace currently has Java 11 installed and this project requires Java 17, so build verification could not complete here.

If you want, I can next update the dev container or project configuration so the backend builds successfully with Java 17.
